The invisible time bomb at your customer

Shipped and assembled undetected — recall and scrap

The flood of data in manufacturing

Every year, modern production lines generate enough data to stack as high as a **church tower.**

Until now, the **technology** to analyse it was missing.

Skills shortage and firefighting

50% of the skilled workers the industry needs are missing today

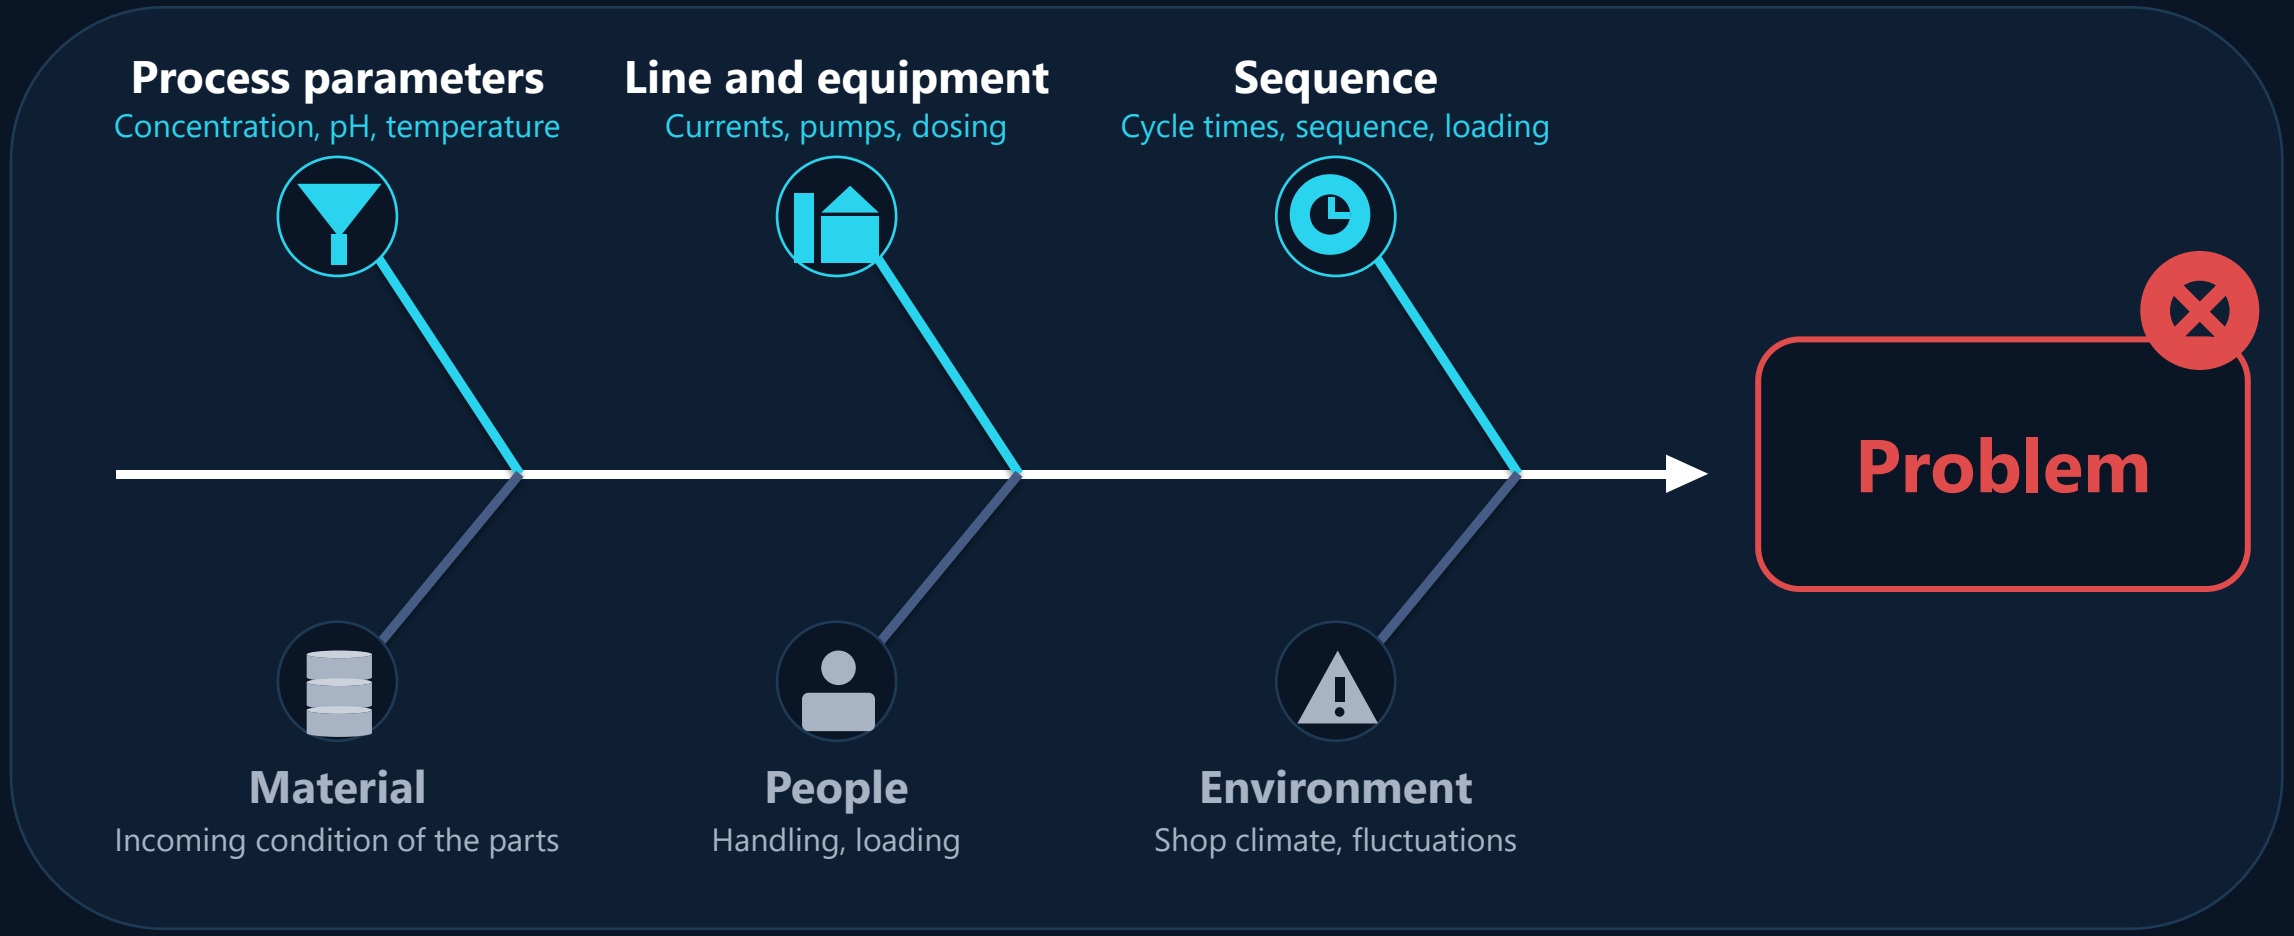

Defects are only **fixed on the surface** — and keep coming back

Root cause analysis in complex processes takes **weeks to months**

The solution: narrowing down causes automatically

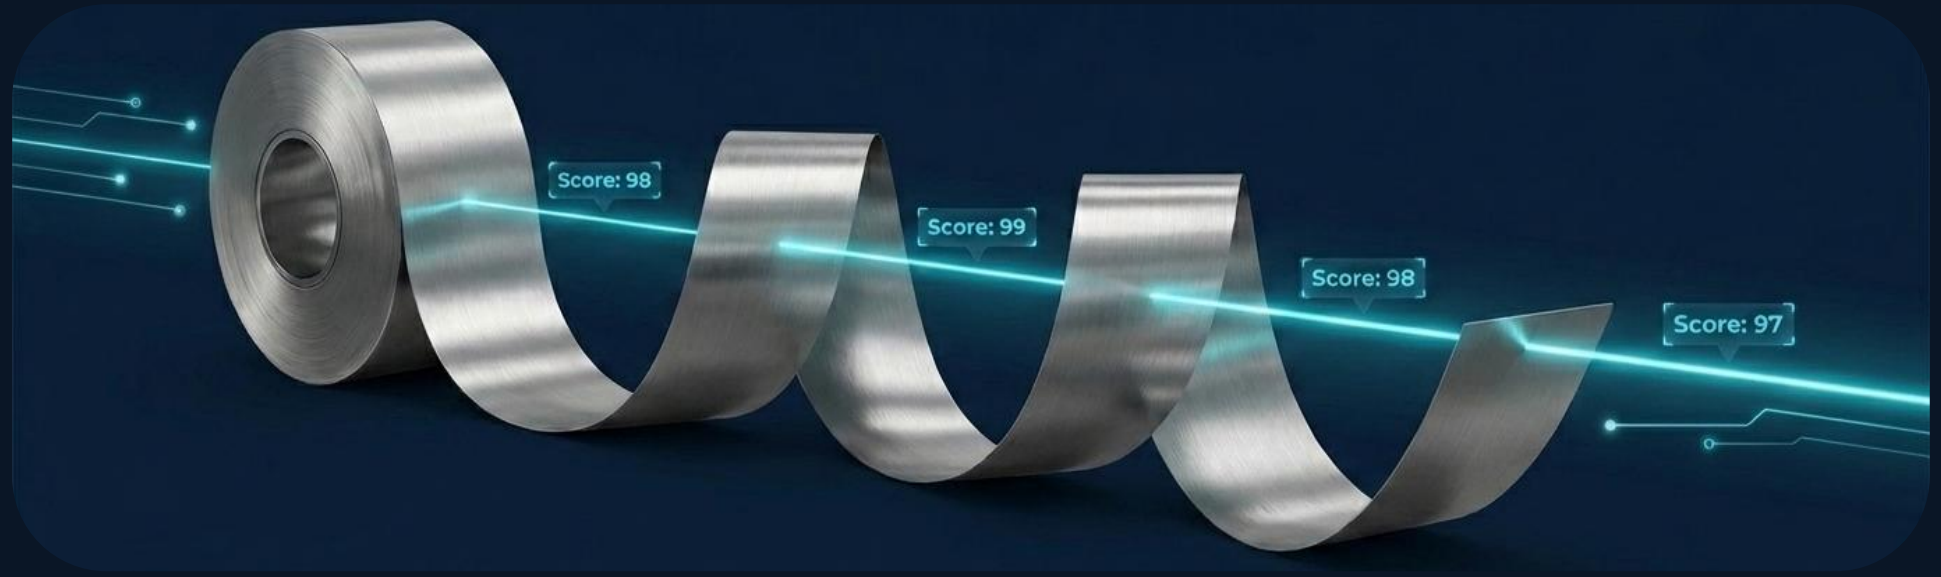

The software checks what the process data holds — your specialists settle the rest

● evidenced in process data

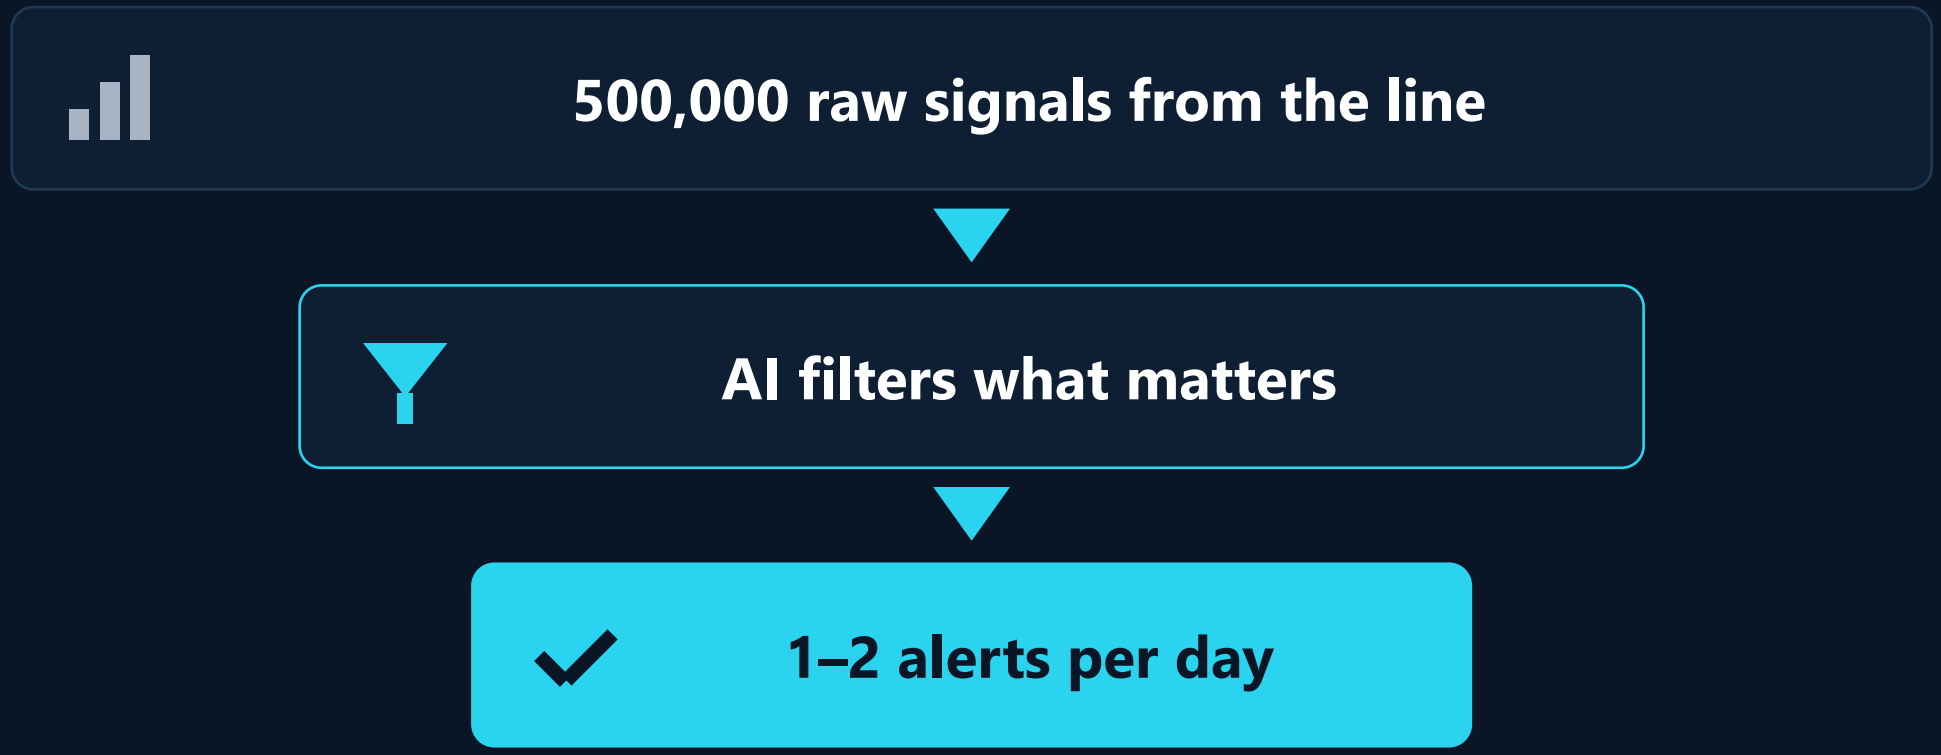

● with your specialists (experience)

Predictive Quality: one quality score per batch

From your process data we calculate the **quality condition of every batch** — so that you can act **before major damage is done.**

The flood of data becomes clear alerts

Many signals become a few clear alerts a person can act on.

Evidence from the pilot project

Here from an electroplating shop — the method fits any process with measurement data

real defect on the part

Flagged batches are inspected before they leave the building — no recalls.

Second example: a Site Assessment at another customer

The most likely causes of a defect pattern — ranked automatically

ERP: defective parts per batch

Data extract from the line controls

Local AI analysis

Merkmal	Warenträger mit Merkmal	Fehlerbild 14 % mit Merkmal	% ohne Merkmal	x-mal so häufig
Meldung 4.8 Unzulässige Regelabweichung	223	10,66	1,52	7,02
Meldung 3.11 WT-Nr. in Position Gleichrichterstörung	227	10,17	1,52	6,69

Temperatur Messgröße 1 niedriger als üblich	160	1,80	1,64	1,10
erster Warenträger nach Stillstand (> 30 min)	982	1,73	1,62	1,07

Main causes of a defect pattern

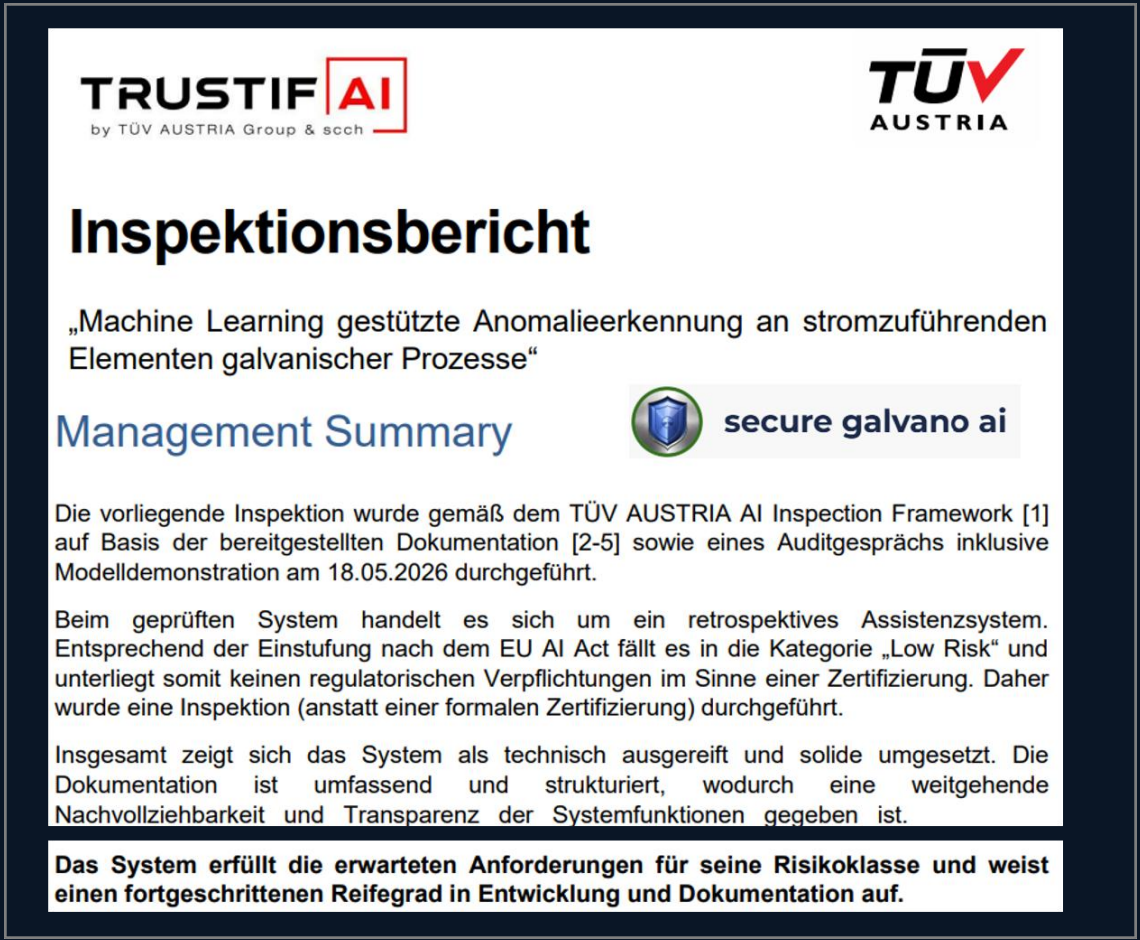

Your effort

1 h briefing · 30 min data extract

On our side

3 days to the first analysis — after that it runs automatically for each defect pattern

Trust through independent audit

TRUSTIF AI
by TÜV AUSTRIA Group & scch

TÜV AUSTRIA

Inspektionsbericht

„Machine Learning gestützte Anomalieerkennung an stromzuführenden Elementen galvanischer Prozesse“

Management Summary

secure galvano ai

Die vorliegende Inspektion wurde gemäß dem TÜV AUSTRIA AI Inspection Framework [1] auf Basis der bereitgestellten Dokumentation [2-5] sowie eines Auditgesprächs inklusive Modelldemonstration am 18.05.2026 durchgeführt.

Beim geprüften System handelt es sich um ein retrospektives Assistenzsystem. Entsprechend der Einstufung nach dem EU AI Act fällt es in die Kategorie „Low Risk“ und unterliegt somit keinen regulatorischen Verpflichtungen im Sinne einer Zertifizierung. Daher wurde eine Inspektion (anstatt einer formalen Zertifizierung) durchgeführt.

Insgesamt zeigt sich das System als technisch ausgereift und solide umgesetzt. Die Dokumentation ist umfassend und strukturiert, wodurch eine weitgehende Nachvollziehbarkeit und Transparenz der Systemfunktionen gegeben ist.

Das System erfüllt die erwarteten Anforderungen für seine Risikoklasse und weist einen fortgeschrittenen Reifegrad in Entwicklung und Dokumentation auf.

TÜV AUSTRIA / TRUSTIFAI

Model audit completed: 2 June 2026

Classification:
EU AI Act low risk

Aligned with:
Information security — ISO/IEC 27001
AI management — ISO/IEC 42001

No one carries a project like this alone — **thank you!**

What your operation gains

Four effects — in any plant that records its process data

Less manual inspection

▼

Lower labour costs

Catch defective batches

▼

Protect customer trust

React faster

▼

Lower cost of defects

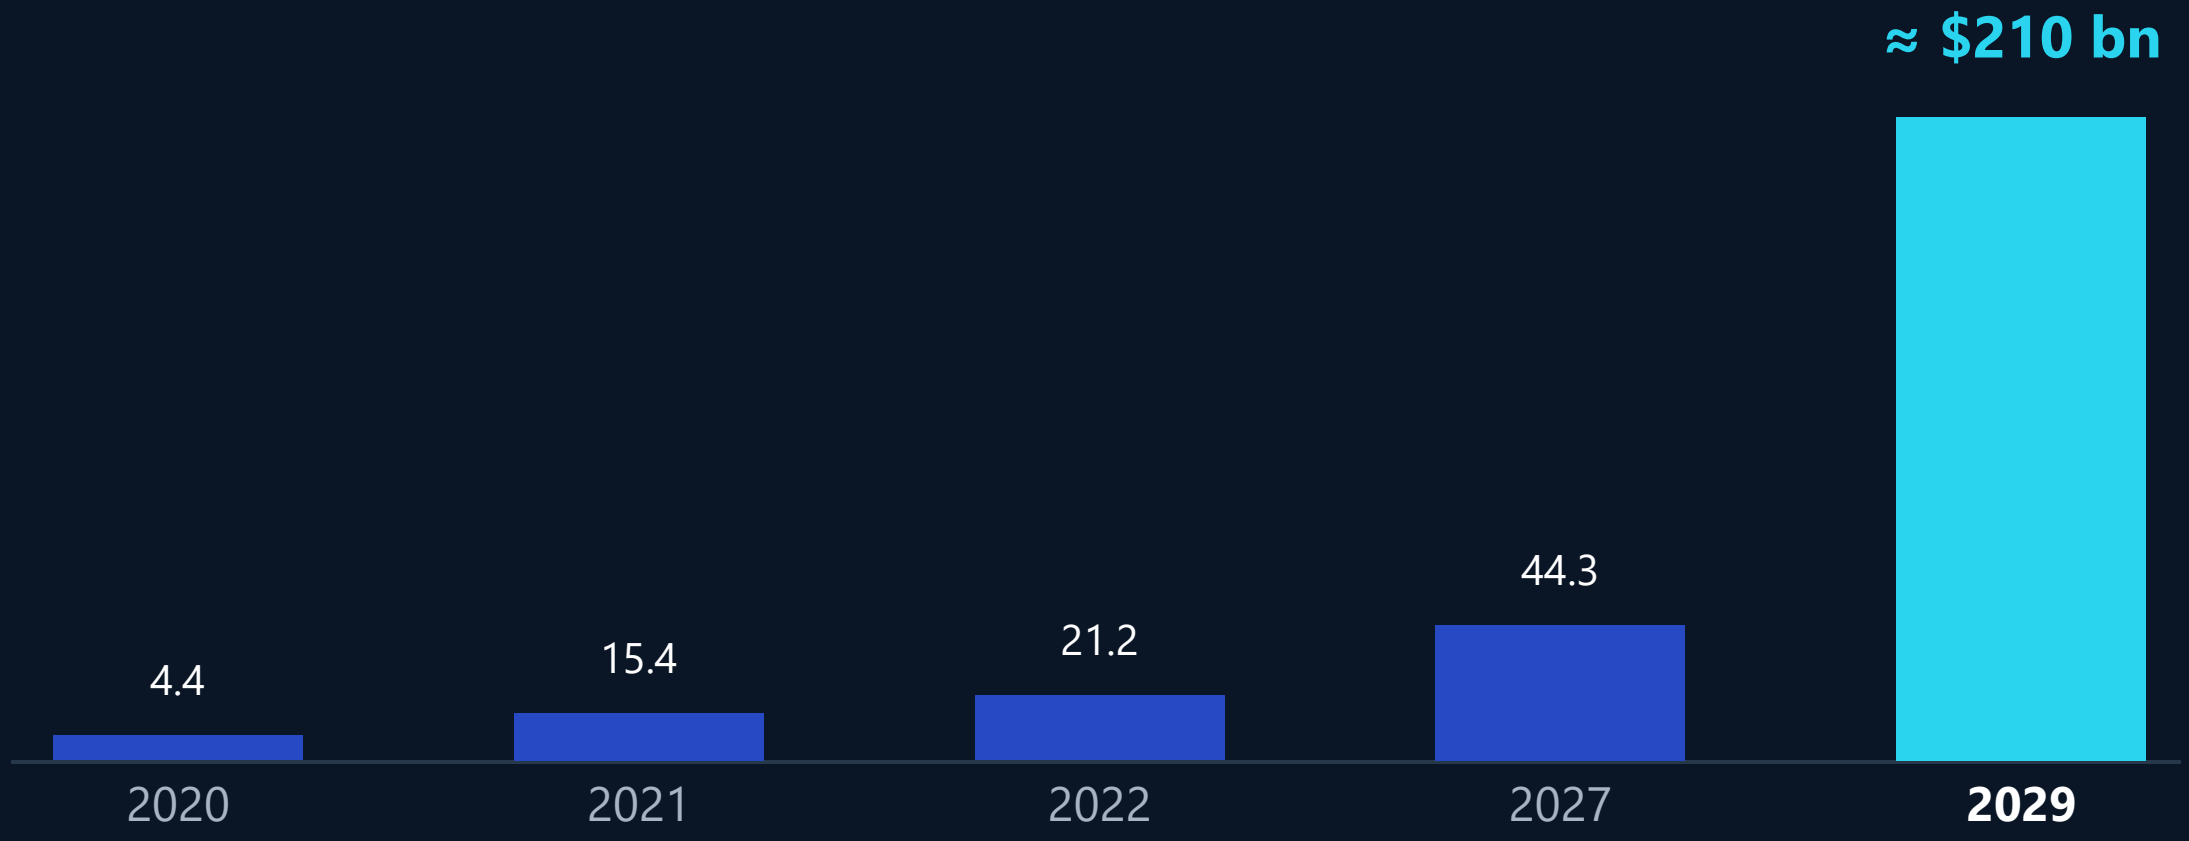

Minimise waste

▼

Reduce the CO_2 footprint

Machine learning market

Global market in bn US dollars — tenfold growth from 2022 to 2029
